

Paths

Paths are sets of **ModuLes** that, combined, make up a broader topic.

Paths can be large "zero-to-hero" ones or smaller, more specialized ones targeting a specific set of topics. You can view what each path is about by expanding the **ModuLes** it contains.

Some **Paths** share modules, especially in the first steps of a path. This allows you to fast-forward a **Path** given that you already possess the required entry-level knowledge.

For example, imagine a scenario where you are interested in following two imaginary **Paths**:

- Active Directory Attacks and Defense
- Modern Web Attacks

Both paths would make sense to have some entry-level **ModuLes** to teach you the basics of Active Directory and web applications. Once you complete the first **Path**, given that the paths share the same entry-level **ModuLes**, you automatically save time on your second **Path** since you will start directly after the shared entry-level topics.
